PRELIMINARY AMENDMENT

Sir:

Please add the following new Claim 10:

In The Claims:

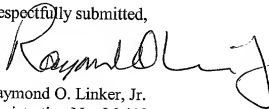

10. (New) The *Bifidobacterium breve* strain I-2219 deposited at the CNCM on May 31, 1999.

10019872.040202

REMARKS

The subject matter of this newly added claim is described in the specification at page 4, lines 7-25.

Respectfully submitted,

Raymond O. Linker, Jr.

PRELIMINARY AMENDMENT

Dear Sir:

Please amend the above-identified application as follows:

Please add the following Abstract of the Disclosure:

**METHOD FOR THE PRODUCTION OF AN IMMUNOSTIMULANT
MILK PRODUCT AND USES THEREOF**

A method for the production of an immunostimulant milk product, characterized in that bioconversion is carried out on or a milk substrate with the aid of a *Bifidobacterium* culture by keeping said substrate in contact with said culture in conditions which are unfavorable with respect to the fermentation of *Bifidobacterium*. The invention also relates to milk foods and products obtained by said method.

10019872-040202

In The Specification:

Page 1, after the title and before the first paragraph (numbered line 4) please insert:

FIELD OF THE INVENTION

Page 1, between the first and second paragraphs (numbered lines 8 and 9) insert:

BACKGROUND OF THE INVENTION

Page 2, between numbered lines 29 and 30 insert:

SUMMARY OF THE INVENTION

Page 5, between numbered lines 37 and 38 insert:

ILLUSTRATIVE EXAMPLES

In The Claims:

1. (Amended) A method for the production of an immunostimulant milk product, said method comprising carrying out bioconversion on a milk substrate with the aid of a *Bifidobacterium* culture by keeping said substrate in contact with said culture, under conditions which are unfavorable to fermentation by *Bifidobacterium*.

2. (Amended) The method as claimed in claim 1, wherein the milk substrate and the *Bifidobacterium* are brought into contact at the rate of 1×10^7 to 1×10^9 CFU per ml of milk substrate, and the final *Bifidobacterium* population at the end of the bioconversion reaction is 1×10^5 to 1×10^9 CFU per ml of product.

3. (Amended) The method as claimed in claim 1, wherein the pH of the milk substrate during the bringing into contact with the *Bifidobacterium* is 6.3 to 7 and the pH of the product at the end of the bioconversion reaction is 6 to 7.

10010872.040202

4. (Amended) The method as claimed in claim 1, wherein the duration of contact between the milk substrate and the bacteria is 6 to 24 hours.

5. (Amended) The method as claimed in claim 1, wherein a *Bifidobacterium* culture comprising the *Bifidobacterium breve* strain deposited on May 31, 1999, under the number I-2219 at the CNCM, is used.

6. (Amended) A milk product obtained by the method as claimed in claim 1.

7. (Amended) The milk product as claimed in claim 6, wherein its pH is 6 to 7.

9. (Amended) The milk food as claimed in claim 8, wherein its pH is 6 to 7.5.

Please add new claim 10 as follows:

10. (New) The milk food as claimed in claim 9, wherein its pH is 6.5 to 6.9.

Version With Markings to Show Changes Made:

1. (Amended) A method for the production of an immunostimulant milk product, said method comprising carrying out bioconversion [characterized in that bioconversion is carried out] on a milk substrate with the aid of a *Bifidobacterium* culture by keeping said substrate in contact with said culture, under conditions which are unfavorable to fermentation by *Bifidobacterium*.

2. (Amended) The method as claimed in claim 1, wherein [characterized in that] the milk substrate and the *Bifidobacterium* are brought into contact at the rate of 1×10^7 to 1×10^9 CFU per ml of milk substrate, and the final *Bifidobacterium* population at the end of the bioconversion reaction is 1×10^5 to 1×10^9 CFU per ml of product.

3. (Amended) The method as claimed in claim 1, wherein [either of claims 1 and 2, characterized in that] the pH of the milk substrate during the bringing into contact with the *Bifidobacterium* is [preferably] 6.3 to 7 and the pH of the product at the end of the bioconversion reaction is [preferably] 6 to 7.

4. (Amended) The method as claimed in claim 1, wherein [any one of claims 1 to 3, characterized in that] the duration of contact between the milk substrate and the bacteria is 6 to 24 hours.

5. (Amended) The method as claimed in claim 1, wherein [any one of claims 1 to 3, characterized in that] a *Bifidobacterium* culture comprising the *Bifidobacterium breve* strain deposited on May 31, 1999, under the number I-2219 at the CNCM, is used.

6. (Amended) A milk product[, characterized in that it is capable of being] obtained by the method as claimed in claim 1 [any one of claims 1 to 5].

10019872.010202

7. (Amended) The milk product as claimed in claim 6, wherein [characterized in that] its pH is 6 to 7.

9. (Amended) The milk food as claimed in claim 8, wherein [characterized in that] its pH is 6 to 7.5[, preferably 6.5 to 6.9].

10019872.0402002

WO 01/01785

METHOD FOR THE PRODUCTION OF AN IMMUNOSTIMULANT MILK
PRODUCT AND USES THEREOF

5 The present invention relates to the use of
bifidobacteria for the preparation of immunostimulant
milk foods which are suitable in particular for use as
infant food: foods which may be in liquid or powdered
form.

10 The genus *Bifidobacterium* belongs to the
Actinomycetaceae family; it groups together Gram-
positive bacilli which are strict anaerobes fermenting
glucose by the fructose-6-phosphate phosphoketolase
pathway. Their optimum pH for growth is between 6 and
7, and their optimum temperature for growth is between
15 37 and 40°C.

Bifidobacteria are part of the normal human
intestinal flora and they are recognized to have
numerous beneficial effects on health. It is in
particular known that breast-fed unweaned babies who
20 possess an intestinal flora in which bifidobacteria are
predominant are more resistant to infections and have
in particular a lower risk of diarrhea than unweaned
babies fed with industrial milk preparations.

The role of bifidobacteria in this increased
25 resistance to infections has not been completely
elucidated. Various studies indicate that they possess
an immunostimulant power which would involve
polysaccharide substances associated with the bacterial
wall, or secreted by the bacteria during anaerobic
30 fermentation. GOMEZ et al., [FEMS Microbiol. Lett., 56,
47-52, (1988)] describe the immunomodulatory effect of
exocellular fractions rich in polysaccharides produced
by *Bifidobacterium adolescentis*; FR Application
published under the number 2652590, in the name of
35 Laboratoires OM, describes an immunopotentiative
exopolymer of a polysaccharide nature produced by
Bifidobacterium infantis longum; HOSONO et al.,
[Biosci. Biotech. Biochem., 61, 312-316 (1997) and
Bioscience Microflora, 17, 97-104, (1998)] describe

10019872.040202

immunopotentiator polysaccharides produced by various *Bifidobacterium* species. The immunomodulatory action of bifidobacteria also manifests itself by the regulation of the intestinal microflora, in particular at the expense of the development of pathogenic bacterial species. ROMOND et al., [Anaerobe, 3, 137-143, (1997), and J. Dairy Sci., 81, 1229-1235, (1998)] thus describe glycoprotein-rich fractions produced by *Bifidobacterium breve* under anaerobic fermentation conditions, and inducing *in vivo* a regulatory effect on the intestinal microflora.

Numerous products fermented by bifidobacteria, optionally combined with other lactic acid bacteria, exist on the market whose ingestion make it possible to benefit from the immunostimulant effects of bifidobacteria and of their fermentation products.

In the case of infant nutrition, however, they have the disadvantage of being too acidic and of having, in particular in the case of powdered products, a nonhomogeneous appearance after reconstitution, because of the coagulation of the milk proteins by the acidity generated during fermentation. They are therefore sometimes poorly accepted by the child or by the mother.

However, the inventors have now discovered that the production, by bifidobacteria, of substances having immunostimulant properties could be carried out without fermentation, and therefore without acidification of the final product.

The subject of the present invention is a method for the production of an immunostimulant milk product, characterized in that bioconversion is carried out on a milk substrate with the aid of a *Bifidobacterium* culture by keeping said substrate in contact with said culture, under conditions which are unfavorable to fermentation by *Bifidobacterium*.

The expression "conditions which are unfavorable to fermentation by *Bifidobacterium*" defines conditions under which the acidification of the medium

10019672.010202

by *Bifidobacterium* does not exceed 0.5 pH units during 8 hours of incubation for an initial inoculation of 1 to 5×10^7 CFU per ml. They can be easily determined by persons skilled in the art with the aid of simple trials, by varying in particular the aeration of the culture medium, its osmotic pressure and/or the culture temperature, and by measuring the pH at the beginning and at the end of the culture.

For a large number of *Bifidobacterium* strains, such conditions may be obtained in particular by:

- keeping under aerobic conditions, for example with stirring;
 - keeping the medium at an osmotic pressure corresponding to a water activity (AW) of 0.93 to 0.97;
 - keeping at a temperature of 40 to 48°C;
- as well as combinations of these various conditions.

The milk substrate and the *Bifidobacterium* may be brought into contact at the rate of 1×10^7 to 1×10^9 CFU per ml of milk substrate, and the final *Bifidobacterium* population at the end of the bioconversion reaction is 1×10^5 to 1×10^9 CFU per ml of product.

The pH of the milk substrate during the bringing into contact with the bacteria is preferably 6.3 to 7 and the pH of the product at the end of the bioconversion reaction is preferably 6 to 7.

Depending on the conditions used, the duration of contact between the milk substrate and the bacteria will be 6 to 24 hours.

The milk substrate may be milk, or any milk-based medium; this may be for example a milk concentrate, a base for infant milk food, a base for yogurt, and the like.

It is possible to add to the milk-based medium the ingredients necessary for producing the product ready for consumption which it is desired to obtain. If, for example, it is desired to obtain a milk food

for unweaned babies, lactose, maltodextrins, minerals, vitamins, fat, and ingredients which make it possible to reconstitute the composition of breast milk, will be added. If desired, the fat is incorporated and then
5 homogenized with the solution so as to obtain a stable emulsion.

The *Bifidobacterium breve* strain which is particularly suitable for carrying out the invention, was deposited in accordance with the Budapest Treaty,
10 on May 31, 1999, under the number I-2219 at the CNCM (Collection Nationale de Cultures de Microorganismes) held by Institut Pasteur, 25 rue du Docteur Roux, in Paris.

This strain has the following characteristics:
15 morphology: short bacilli with rare Y and V shapes

metabolism: anaerobiosis; production of L-(+)-lactic and acetic acids.

fermentation of sugars: glucose, galactose,
20 fructose, maltose, sucrose, lactose, esculin, ribose, mannitol, sorbitol, D-raffinose, melibiose.

The subject of the present invention is also a liquid milk product characterized in that it may be obtained using a method in accordance with the
25 invention.

This product preferably has, at the end of the bioconversion reaction, a pH of 6 to 7.

By way of comparison, the prior art products obtained by fermentation by *Bifidobacterium* have, at
30 the end of fermentation, a pH of 4 to 4.6.

This product may be consumed as it is, or may be subjected to various treatments whose nature varies according to the ready-to-eat product which it is desired to obtain. It may, for example, be supplemented
35 with texturing agents, flavoring agents, vitamin or mineral supplements, fat and the like, if these were not added to the original medium. It may also be concentrated or diluted.

10019872.010202

A milk product in accordance with the invention can serve as base for the preparation of fresh milk foods.

Advantageously, it may also be used for the preparation, by sterilization and/or dehydration, of foods with long shelf life. Indeed, it preserves its immunostimulant properties even in the absence of live bacteria, for example after desiccation and UHT sterilization.

The present invention also covers the fresh, sterilized or dehydrated milk foods obtained from a milk product in accordance with the invention.

It also covers the reconstituted milk foods obtained by adding water to the dehydrated milk foods in accordance with the invention.

The (fresh, sterilized or reconstituted) milk foods in accordance with the invention generally have a pH of 6 to 7.5, preferably of 6.5 to 6.9.

Unlike the foods resulting from fermentation by *Bifidobacterium* which are known in the prior art, the milk foods in accordance with the invention are not acidic, and contain the milk proteins in soluble, noncoagulated form. Upon addition of water to the dehydrated milk foods in accordance with the invention, it is thus possible to obtain a homogeneous product, without precipitation or phase separation.

The milk foods in accordance with the invention, by virtue of their immunostimulant effect, confer protection against microbial and viral infections comparable to that of the foods resulting from fermentation by *Bifidobacterium* which are known in the prior art, without having the disadvantages thereof in terms of modification of the taste and of the appearance of the product. They are particularly suitable for use as infant food, and in particular as food for unweaned babies, but they may also be used as food for subjects of all ages.

The present invention will be understood more clearly with the aid of the additional description

10019872-040202

which follows, which refers to examples of preparation of milk products in accordance with the invention.

EXAMPLE 1: MANUFACTURE OF A POWDERED DIETETIC MILK PREPARATION FOR UNWEANED BABIES, WITH IMMUNOSTIMULANT ACTIVITY

A milk concentrate is prepared whose composition, expressed in g per 100 g of dry matter, is the following:

	Milk proteins (80% casein and 20% serum	
10	proteins)	13
	Vegetable fat	25.5
	Lactose	42.25
	Maltodextrins	16
	Minerals	3
15	Vitamins	0.25

The vegetable fat is added to a skimmed cow's milk, heated to 75°C. Homogenization is performed at the same temperature in 2 stages, the first under 200 kgs/cm², the second under 50 kgs/cm². The lactose and the maltodextrins, previously dissolved in water, are then added, followed by the solutions of vitamins and minerals.

The final mixture is pasteurized at 115°C and then concentrated by evaporation to 48% dry matter.

The concentrate, cooled to 37°C, is then inoculated at the rate of 5% with a *B. Breve* I-2219 culture containing 10⁹ bacteria/ml. The initial pH is 6.15 and the osmotic pressure is 0.96.

After incubating for 8 h at 37°C, in a tank under air with periodic stirring for 10 minutes every 2 hours, the pH is 6.1 and the *B. Breve* population is 10⁶ bacteria/ml. The Dornic acidity is 48°D.

The concentrate is spray-dried. The powder obtained, when added to water in an amount of 140 g per liter of water, makes it possible to obtain a reconstituted milk which possesses the following characteristics: pH 6.6, Dornic acidity 12°D; liquid milk appearance with no curd grains.

EXAMPLE 2: MANUFACTURE OF A READY-TO-USE, UHT-STERILIZED AND ASEPTICALLY PACKAGED DIETETIC MILK PREPARATION FOR UNWEANED BABIES, WITH IMMUNOSTIMULANT ACTIVITY

5 A mixture is prepared whose composition (in g/liter) is the following:

	Proteins	21
	Fat	24
	Carbohydrates	83
10	Minerals	5
	Vitamins	0.45

 This mixture is prepared from the following ingredients (per 100 liters of finished product):

- 58 liters of skimmed milk,
- 15 - 2.4 kgs of fat,
- 4.7 kgs of lactose,
- 0.7 kgs of maltodextrins,
- 0.3 kg of vitamins,
- 0.05 kg of mineral complex.

20 The milk is heat-treated beforehand using the UHT system to a temperature of 115 to 120°C.

 The fat is incorporated into the milk which has been cooled to 70°C and homogenization is performed in 2 stages, 200 kgs during the 1st stage, 50 kgs in the
25 2nd stage.

 The mixture is cooled to 37-38°C, and then inoculated at 1.5% with a CNCM I-2219 culture containing $1 \text{ to } 5 \times 10^9$ bacteria/ml.

30 Incubation is carried out at 37°C for 8 hours under conditions identical to example 1 above, followed by cooling to 5°C.

 The pH of the product is 6.3 and the *B. Breve* population is 3×10^7 bacteria/ml. The Dornic acidity is 23°D.

35 The remainder of the ingredients is dissolved in 50 liters of water approximately and then added to the product obtained at the end of the incubation.

10019872-040202

The mixture thus produced is subjected to a UHT treatment at 140°C for 6 to 7 seconds before being aseptically packaged.

5 **EXAMPLE 3: IMMUNOSTIMULANT EFFECT OF MILK PRODUCTS IN ACCORDANCE WITH THE INVENTION**

The immunostimulant effect of the milk preparations in accordance with the invention was studied as follows:

- by the development of fecal flora on mice
10 with human flora;
- by the regulation of the phenomenon of translocation on monoxenic mice with *Clostridium perfringens*.

15 **Studies of the development of the fecal flora in mice with human flora:**

The mice are of the adult C3H line with human flora.

This is the G1 generation, the G0 generation being axenic mice associated in adulthood with the
20 human flora.

- Number of mice per group: 6
- Number of trials: 2 per product.

The mice are kept for 1 week in the same cage and then divided 6 to a cage.

25 The age of the mice at the beginning of the trials is 8 weeks minimum and 11 weeks maximum.

The following will be monitored in the fecal flora:

- bifidobacteria
- 30 - *Bacteroides fragilis*
- spores of *Clostridia*
- optionally spores of *Cl. perfringens*

Microbiological techniques

The fecal sample is collected immediately
35 before use, aseptically weighed and diluted in pre-reduced Ringer's solution (diluted one quarter and supplemented with cysteine hydrochloride at 0.3 g/l).

Enumeration of bifidobacteria and *Bacteroides fragilis* on pre-reduced BEERENS and BBE media

inoculated directly and incubated under anaerobic conditions.

For the test for *Clostridium* spores:

- the suspensions are heated for 10 minutes at 75°C and inoculated on Columbia agar supplemented with glucose (5 g/l) and cysteine hydrochloride (0.3 g/l) and incubated for 5 days,

- the *Clostridium* colonies are identified by their morphology and a negative catalase reaction. The cell morphology is determined after Gram staining 3.

The results obtained with a control milk preparation which had been inoculated with the ferment CNCM I-2219 and administered immediately are illustrated by table I below (contact time = 0)

15 Table I

	T 0	T 7 days	T 15 days
Bifidobacteria	8.2 ± 0.3	9.3 ± 0.1	8.6 ± 0.1
Bacteroides fragilis	7.2 ± 0.5	9.3 ± 0.1	9.2 ± 0.1
Clostridium	4.3 ± 0.1	5.1 ± 0.5	6.7 ± 0.3

The results are expressed in log and the figures represent the mean of the results for the 6 mice; a significant increase in *Bacteroides fragilis* and *Clostridia* is observed, hence an infectious risk.

- 20 The results obtained with a milk preparation in accordance with the invention, inoculated and having been subjected to an 8-hour contact at 37°C with CNCM I-2219, are illustrated by table II below.

Table II

	T 0	T 7 days	T 15 days
<i>Bifidobacteria</i>	7.1 ± 0.1	11 ± 0.5	10.3 ± 0.8
<i>Bacteroides fragilis</i>	8 ± 0.2	7.9 ± 0.3	nd < 4.7 log
<i>Clostridium</i>	3.9 ± 0.3	4.4 ± 0.2	4 (1 mouse) 5 others: absence
<i>C. perfringens</i>	3.7 ± 0.9	nd	nd

- 25 nd: not determined

A 2.5 log increase in bifidobacteria and a very large reduction in *Bacteroides* and *Clostridia* is

observed, relative to the control, in particular after administering for 15 days.

Studies on monoxenic mice with *Clostridium perfringens*:

Objective: to verify the influence of the products in accordance with the invention on the dissemination of intestinal bacteria in various organs.

Experimental condition: axenic mice (age = 8 weeks) kept in a sterilized isolating unit, fed on RO3 base sterilized by irradiation.

Products tested:

- ultrapure water sterilized by autoclaving
- ultrapure water sterilized by autoclaving supplemented with a preparation in accordance with the invention (PII) at the rate of 14 g (weight of powder) per 100 ml of water.

These solutions are prepared in a sterile manner daily and given ad libitum to the mice for 6 days. At the end of this period, *C. perfringens* strain LAB (human intestinal origin) is inoculated at the rate of 3.5 to 4.5 log CFU per mouse. The implantation and dissemination of *Clostridium perfringens* in the lymphoid organs are measured by sacrificing two mice per group 24, 48 hours, 4 days and 7 days after inoculation. The counts are performed by the most probable number method with three tubes in LS medium (incubation 46°C 24-48 hours).

The results are illustrated by table III below:

10019872-040202

Table III

	D1		D2		D4		D7	
	PII	Water	PII	water	PII	water	PII	water
Ileum proximal	2	2	0	1	0	2	2	2
Median	2	0	0	1	0	2	2	2
Distal	2	0	0	1	0	2	2	2
Cecum	2	0	0	2	1	2	2	2
Colon	2	2	0	2	2	2	2	2
Peyer's patches	1	1	0	0	1	2	2	2
Mesenteric ganglia	0	2	0	0	1	2	1	2
Bacteriemia	0	0	0	0	0	0	0	0
Spleen	0	1	0	2	0	2	1	2
Liver	0	0	0	0	1	2	2	2
Kidney	0	1	0	2	1	2	1	2
Lung	0	0	0	0	0	2	0	0

Legend to table III:

0 = low implantation/dissemination

1 = average implantation/dissemination

5 2 = high implantation/dissemination

The following are observed:

- a 24-hour delay in implantation of *C. Perfringens* after administration of the product in accordance with the invention;

10 - low dissemination in the lymphoid organs in mice which consumed the product in accordance with the invention (PII).

15 These results show that the preparations in accordance with the invention regulate the dissemination of *Clostridium perfringens* in the lymphoid organs.

10019872-040202

CLAIMS

1. A method for the production of an immunostimulant milk product, characterized in that
5 bioconversion is carried out on a milk substrate with the aid of a *Bifidobacterium* culture by keeping said substrate in contact with said culture, under conditions which are unfavorable to fermentation by *Bifidobacterium*.
- 10 2. The method as claimed in claim 1, characterized in that the milk substrate and the *Bifidobacterium* are brought into contact at the rate of 1×10^7 to 1×10^9 CFU per ml of milk substrate, and the final *Bifidobacterium* population at the end of the
15 bioconversion reaction is 1×10^5 to 1×10^9 CFU per ml of product.
3. The method as claimed in either of claims 1 and 2, characterized in that the pH of the milk substrate during the bringing into contact with the
20 *Bifidobacterium* is preferably 6.3 to 7 and the pH of the product at the end of the bioconversion reaction is preferably 6 to 7.
4. The method as claimed in any one of claims 1 to 3, characterized in that the duration of contact
25 between the milk substrate and the bacteria is 6 to 24 hours.
5. The method as claimed in any one of claims 1 to 3, characterized in that a *Bifidobacterium* culture comprising the *Bifidobacterium breve* strain deposited
30 on May 31, 1999, under the number I-2219 at the CNCM, is used.
6. A milk product, characterized in that it is capable of being obtained by the method as claimed in any one of claims 1 to 5.
- 35 7. The milk product as claimed in claim 6, characterized in that its pH is 6 to 7.
8. A milk food obtained from a product as claimed in claim 7.

10019872.040202

9. The milk food as claimed in claim 8, characterized in that its pH is 6 to 7.5, preferably 6.5 to 6.9.
